

# Ultrasound patient information

# Transvaginal ultrasound

An ultrasound examination is performed by a trained health professional (a sonographer or doctor) using a small, hand-held device called a transducer (or probe). The transducer transmits ultrasound waves which are relayed back to the ultrasound machine to produce images or pictures onto an ultrasound screen. Pictures are taken during the examination.

# What is a transvaginal ultrasound?

Transvaginal ultrasound differs from an abdominal ultrasound as it looks at the pelvic organs from inside the vagina. It can be performed during pregnancy to assess the position of the placenta and the appearances of the cervix, with no known risks to the fetus (unborn baby).

# How do I prepare for a transvaginal ultrasound?

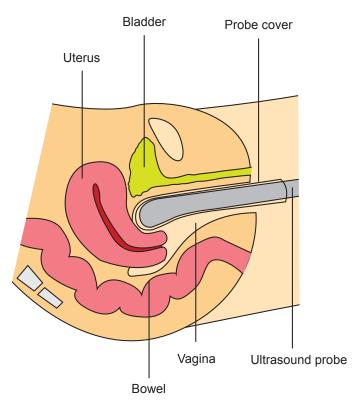

You will be asked to empty your bladder, prior to the transvaginal ultrasound examination.

You will be asked for your consent prior to having the test.

# What happens during a transvaginal ultrasound?

After emptying your bladder you will be asked to wear a gown and undress from the waist down. You will then be asked to lie on an examination couch. A sheet is provided to cover you. You will be asked to bend your legs and the transducer is inserted into the vagina. The transducer is slightly larger than a tampon and especially shaped to fit comfortably into the vagina. A protective cover is placed over the transducer and lubricating gel is applied to it for ease of insertion.

Please let the sonographer know if you have any allergies to latex or rubber before the examination.

Once the transducer is in position, the sonographer moves it to image the pelvic organs. The transvaginal ultrasound examination is recognised as being safe, with minimal discomfort.

Another member of staff will be present during the transvaginal ultrasound to chaperone and assist the sonographer during the ultrasound examination.

#### How long does a transvaginal ultrasound take?

The examination usually takes between 3-15 minutes depending upon the reason for the scan.

### What are the benefits of a transvaginal ultrasound?

The insertion of the transducer into the vagina allows a clear view of the pelvic organs and very clear ultrasound images to be taken of the area. This will help to guide the discussion between you and your doctor about any further investigation or treatment that may be needed.

#### Are there any risks of a transvaginal ultrasound?

There is a possible small risk of infection from a transvaginal ultrasound examination. This risk is minimised with probe disinfection protocols, which are strictly followed in the ultrasound department and after every examination the probe must pass this strict disinfection process. This disinfection policy complies with Australian Standards.

# When can I expect the results of my transvaginal ultrasound?

The time it takes for your doctor to receive a written report will vary.

Please feel free to ask when the written report will be provided to your doctor.

It is important that you discuss the results with your doctor, either in person or on the telephone, so that they can explain what the results mean for you.

Should you require further information regarding transvaginal ultrasound please ask the sonographer.

Further information on specific examinations can be found at insideradiology.com.au.
